

Pipeline Description

Overview

The deployment pipeline is configured in `.circleci/config.yml`. CircleCI is connected to the GitHub repository and runs the workflow when code is pushed to the `main` or `master` branch.

Pipeline Steps

1. Checkout source code from GitHub.
2. Install frontend dependencies with `npm run frontend:install`.
3. Install API dependencies with `npm run api:install`.
4. Run frontend linting with `npm run frontend:lint`.
5. Build the frontend with `npm run frontend:build`.
6. Build the API with `npm run api:build`.
7. Persist the frontend and API build outputs to the CircleCI workspace.
8. Wait for manual approval in the `hold` job.
9. Deploy the API to Elastic Beanstalk with `npm run api:deploy`.
10. Deploy the frontend build to S3 with `aws s3 sync`.
11. Configure the S3 bucket for static website hosting.

Pipeline Diagram

See [Pipeline.md](#).

CircleCI Screenshots

The screenshot displays the CircleCI web interface. At the top, a notification bar indicates a 'MAINTENANCE' status. Below this, the 'Workflows' section shows a list of workflows, including 'udagram' and 'build'. The 'build' workflow is selected, and its details are shown on the right. The 'build' workflow has a duration of 2m 14s and is executed on a 'Large' executor. The steps of the 'build' workflow are listed as follows:

Step	Duration
Spin up environment	13s
Preparing environment variables	0s
Install Node.js 14.15	4s
Checkout code	0s
Install Front-End Dependencies	25s
Install API Dependencies	13s
Front-End Lint	5s
Front-End Build	53s
API Build	14s
Persisting to workspace	0s

Secrets

Production secrets are configured in CircleCI project environment variables and passed to the deployment commands. These values are not committed to the repository.

Required CircleCI environment variables include:

- `AWS_ACCESS_KEY_ID`
- `AWS_SECRET_ACCESS_KEY`
- `AWS_DEFAULT_REGION`
- `AWS_BUCKET`
- `POSTGRES_HOST`
- `POSTGRES_PORT`
- `POSTGRES_DB`
- `POSTGRES_USER`
- `POSTGRES_PASSWORD`
- `JWT_SECRET`
